

WHY CAN'T I VISIT MY CLOSE SOCIAL CONTACTS?

We are trying to slow the spread of this virus. Every time you come into contact with another household, you increase your risk of either being exposed to the virus, or exposing others to the virus.

BUT I'M ONLY SEEING MY REALLY GOOD FRIENDS – IT'S ONLY ONE HOUSEHOLD!

Yes, but if that household is visiting another household, it creates a pathway for the virus to potentially jump from household to household. See visual below. The more opportunities the virus has to jump between households, the higher likelihood of people getting sick. The more often the virus is spread, the higher likelihood of a high-risk person being exposed. Even just one interaction between households could lead to disease transmission.
